When You Know – You Know!

Now with the versatility of 298X you can achieve a properly sloped surface on a roof installation.

- **298X** aids in the restoration of roofs with ponding areas and sloping for drainage.
- **298X** contains a proprietary filler that increases the volume solids of the emulsion, making it much more effective as a fill coat over rough surfaces and for higher build in areas that have ponding or need sloping.
- **298X** has a special light weight component along with fibers and polymers added to the standard #298 Asphalt Emulsion to maintain volume after drying. The increased volume lessens the shrinkage in ponding or sloping areas after drying.
- **298X** converts the asphalt emulsion into a high-volume solids, light weight product.
